DIGITAL OUTPUT RS422

Magnetostrictive transducers of the MSB-...-S-F1 series supply digital outputs in START/STOP format with RS422 differential serial transmission. The transducer requests an initialisation pulse that launches sampling.

The following pulses are transmitted on the outputs:

Start: the Initialisation pulse retransmitted

Stop: the pulse corresponding to the position of each magnet.

The time between the Start pulse and the subsequent Stop pulses is proportional to the position of each magnet according to the "Magnetostrictive wave propagation speed" constant, equal to about 2900 m/s.

$$P = \text{Time} * 2900 \text{ m/s}$$

The correct propagation speed for each product is shown on the product label.

Resolution in terms of metres is linked to the resolution used to measure time

1 µs (1 MHz) => 2.9 mm

10 ns (100 MHz) => 29 µm

1 ns (1GHz) => 2.9 µm

The measurement reference is the leading edge of the pulse. Optimum width of the interrogation pulse is 3 µs, but the transducer works correctly for times from 1.5 to 5 µs.
